

This utility is used in 4 steps

- 1) Create your disk image using the Snow Leopard DVD.
- 3) Install Xcode and MacPorts using the commands included in the utility.
- 4) Create the deployment disk image that is finalized in 10.6.8.
- 5) Deploy the image on an internal or external SSD.

(IMPORTANT NOTE): You must always exit the program using the X option.

Other Note: OpenCore Duet Bootloader Installation Package will be available at the end of the deployment on the SSD, this program is only usable for Hackintosh so if you have a real Mac close it that's it.

Use this PDF as a reference and carefully follow the steps in the [video Link](#) which will of course be cut to avoid unnecessary loss of time.
