

This utility is used in 4 steps

- 1) Create your disk image using the Snow Leopard DVD.
- 3) Install Xcode and MacPorts using the commands included in the utility.
- 4) Create the deployment disk image that is finalized in 10.6.8.
- 5) Deploy the image on an internal or external SSD.
- 6) Anytime using Chameleon Bootloader Package.

(IMPORTANT NOTE):

You must always exit the program using the X option.

Other Note: Chameleon Bootloader Installation Package will be available at the end of the deployment on the SSD, Chameleon is only for Hackintosh, so if you have a real Mac close it that's it.

(NOTE Video change: Chameleon Bootloader Installation Package is now used instead of OpenCore.

PHP56 is no longer used in the program.)

Use this PDF as a reference and carefully follow the steps in the [video Link](#) which will of course be cut to avoid unnecessary loss of time.
